

WEATHER FORECASTING RESEARCH PART IV  
Alphee Lavoie, 4/8/2015

C.C. Zain found that the moon and its dispositor, the IC, and the ascendant and its ruler are very important in predicting the weather. Remember that this research was done using the quarter of the Moon.

Do planetary aspects to these points help to predict rainy weather?

HERE ARE SOME CRITERIA IS THAT STOOD OUT TO BRING IN WET WEATHER.

Pluto oppose the ascendant chi-square 3.7 probability 94.7% often  
Pluto conjunct the moon chi-square 4.8 probability 97.2% often  
Neptune conjunct the ascendant chi-square 3.6 probability 94.3% often  
Neptune oppose the ruler of the IC chi-square 5.4 probability 98% often  
Neptune square is the ruler of the IC chi-square 5.8 probability 98.4% often  
Neptune conjunct the ruler of the IC chi-square 4.2 probability 96.0%  
Neptune conjunct the ruler of the ascendant chi-square 6.2 probability 98.8% often  
Saturn squares the moon chi-square 4.5 probability 96.7 often  
Saturn conjunct the ascendant chi-square 7.7 probability 99.4% often  
Uranus conjunct the ruler of the IC chi-square 4.4 probability 96.3% often  
Uranus conjunct planets in the IC chi-square 2.2 probability 85.7% often  
Uranus oppose the IC chi-square 2.5 probability 88.5% often  
Mars oppose the IC chi-square 4.2 probability 95.9% often  
Mars oppose ruler of the ascendant chi-square 4.6 probability 96.8% often

THE FOLLOWING CRITERIA IS SELDOM TO BRING WET WEATHER

Uranus conjunct the ascendant chi-square 5.6 probability 92.2% seldom  
Uranus sextile the IC chi-square 3.3 probability 93.1% seldom  
Uranus conjunct the ruler of the ascendant chi-square 5.3 probability 97.8% seldom  
Uranus conjunct the ascendant chi-square 3.6 probability 94.1% seldom  
Uranus trine's the ruler of the ascendant chi-square 5.8 probability 98.4% seldom  
Saturn trine the ruler of the IC chi-square 4.3 operability 96.2% seldom  
Neptune sextile the ruler of the IC chi-square 2.7 probability 91.1% seldom  
Pluto sextile the IC chi-square 6.0 probability 98.6% seldom  
Pluto sextile the ruler of the ascendant chi-square 6.1 probability 98.7% seldom

**CONCLUSION:**

Notice that the conjunctions and the oppositions to these points happen more often and have a better probability. The planets Uranus, Neptune, and Pluto had the strongest results. Also I found that the planet Pluto was more tied to the ascendant and its ruler and the planet Uranus was more tied to the IC and had hardly anything to the ascendant or its ruler. Neptune was strong to the ascendant and the IC. The research also shows that Venus and Saturn conjunct the ascendant was high improbability. Planets aspect to the quarter Moon was hardly noticeable. The aspects were more to the ascendant and the IC.

What I loved about this whole research was that I found that the easy aspects, the sextile and the trine, hitting these points had a high probability of no rain. It proves what astrologers have

been saying for years. The conjunctions, oppositions and squares create action and the sextiles and the trines are too lazy to produce results.

Another great example that with statistical research you can prove the validity of the aspects.
